

Bourne-Again SHell and Linux CLI

© 2019 Martin Bruchanov, bruxy@regnet.cz

Set interpreter: `#!/bin/bash` Remarks: `# this is comment`

1. Interactive control

Action	set -o vi	set -o emacs
vi-command mode (C)	ESC	—
Previous/next command in history	↑ / ↶	CTRL+p / CTRL+n PAGEUP / PAGEDOWN
Automatic fill of file name	ESC ESC	TAB
List of all matches	ESC G	Tab tab
Horizontal move in command line	h / l	CTRL+b / CTRL+f ← / →
Jump to line begin/end	␣ / \$	CTRL+a / CTRL+e
Backward/forward search in history	/ / ?	CTRL+r / CTRL+s
Delete word to the end/begin	d w / d b	ESC d / ESC h
Delete text from cursor to the line end/begin	d \$ / d ␣	CTRL+k / CTRL+u

1.1. Command line history

- history**, **fc -l** – display numbered history of commands
- !n** – run command number *n*
- !p** – run last command beginning by *p*
- !!** – repeat last entered command
- !!:n** – expand *n*-th parameter of last command
- !\$** – expand the last parameter of last command
- fc** – run defined **\$EDITOR** wit last command
- fc -e vim z k** – open vim editor with commands from *z* to *k*
- ^old^new** – substitute *old* with *new* in last command
- program `!!`** – use output of last command as input

1.2. Help and manuals

- type -a command** – information about command
- help command** – brief help on bash command
- man command**, **info command** – detailed help
- man -k key**, **apropos key**, **whatis key** – find command

2. Debugging

Run a script as: **bash option script and its parameters**

- bash -x** – print commands before execution
- bash -u** – stop with error if undefined variable is used
- bash -v** – print script lines before execution
- bash -n** – do not execute commands

3. Variables, arrays and hashes

- NAME=10** – set value to variable **\$NAME**, **\${NAME}**
- export NAME=10**, **typedef -x NAME** – set as environment variable
- D=\$(date)**; **D=`date`** – variable contains output of command **date**
- env**, **printenv** – list all environment variables
- set** – list env. variables, can set bash options and flags **shopt**
- unset name** – destroy variable of function
- typeset**, **declare** – set type of variable
- readonly variable** – set as read only
- local variable** – set local variable inside function
- \${!var}**, **eval \\$\$var** – indirect reference
- \${parameter-word}** – if *parameter* has value, then it is used, else *word* is used
- \${parameter=word}** – if *parameter* has no value assing *word*. Doesn't work with \$1, \$2, etc.
- \${parameter:-word}** – works with \$1, \$2, etc.
- \${parameter?word}** – if *parameter* has value, use it; if no display *word* and exit script.
- \${parameter+word}** – if *parameter* has value, use *word*, else use empty string
- array=(a b c)**; **echo \${array[1]}** – print ,b'
- array+=(d e f)** – append new item/array at the end
- \${array[*]}**, **\${array[@]}** – all items of array
- \${#array[*]}**, **\${#array[@]}** – number of array items
- declare -A hash** – create associative array (from version)
- hash=(**[key1]=value** [**"other key2"="other value"**])** – store items
- \${hash["other key2"]}**, **\${hash[other key2]}** – access
- \${hash[@]}**, **\${hash[*]}** – all items
- \${!hash[@]}**, **\${!hash[*]}** – all keys

3.1. Strings

- STRING="Hello"** – indexing: **H**₀ **e**₁ **l**₂ **l**₃ **o**₄
- STRING+=" world!"** – concatenate strings
- \${#string}**, **expr length \$string** – string length
- \${string:position}** – extract substring from position
- \${string:position:length}** – extract substr. of length from position
- \${string/substring/substitution}** – substitute first occurrence
- \${string//substring/substitution}** – substitute all
- \${string/%substring/substitution}** – substitute last occurrence
- \${string#substring}** – erase shortest substring
- \${string##substring}** – erase longest substring

3.2. Embedded variables

- ~**, **\$HOME** – home directory of current user
- \$PS1**, **\$PS2** – primary, secondary user prompt
- \$PWD**, **~+ / \$OLDPWD**, **~-** – actual/previous directory
- \$RANDOM** – random number generator, 0 – 32,767
- \$?** – return value of last command
- \$\$** – process id. of current process
- #!** – process id. of last background command
- \$PPID** – process id. of parent process
- \$-** – display of bash flags
- \$LINENO** – current line number in executed script
- \$PATH** – list of paths to executable commands

- \$IFS** – Internal field separator. List of chars, that delimiter words from input, usually space, tabulator **\$'\t'** and new line **\$'\n'**.

4. Script command line parameters

- \$0**, **\${0}** – name of script/executable
- \$1** to **\$9**, **\${1}** to **\${255}** – positional command line parameters
- PAR=\${1:?}"Missing parameter"** – error when **\${1}** is not set
- PAR=\${1:-default}** – when **\${1}** is not set, use *default* value
- \$#** – number of command line parameters (argc)
- \${!#}** – the last command line parameter
- \$*** – expand all parameters, **"\$*" = "\$1 \$2 \$3..."**
- \$@** – expand all parameters, **"\$@" = "\$1" "\$2" "\$3"..."**
- \$ _** – last parameter of previous command
- shift** – rename arguments, \$2 to \$1, \$3 to \$2, etc.; lower counter **\$#**
- xargs command** – read stdin and put it as parameters of *command*

4.1. Read options from command line

```
while getopts "a:b" opt; do case $opt in
a) echo a = $OPTARG ;;
b) echo b ;;
\?) echo "Unknown parameter!" ;;
esac; done
shift $((($OPTIND - 1)); echo "Last: $1"
```

5. Control expressions

- (commands)**, **\$(commands)**, **`commands`**, **{commands}** – run in subshell
- \$(program)**, **`program`** – output of program replaces command
- test**, **[]** – condition evaluation:
 - numeric comparison: **a -eq b ...a = b**, **a -ge b ...a ≥ b**, **a -gt b ...a > b**, **a -le b ...a ≤ b**, **a -lt b ...a < b**
 - file system: **-d file** is directory, **-f file** exists and is not dir., **-r file** exists and is readable, **-w file** exists and is writable, **-s file** is non-zero size, **-a file** exists
 - logical: **-a** and, **-o** or, **!** negation
- [[]]** – comparison of strings, equal **=**, non-equal **!=**, **-z string** is zero sized, **-n string** is non-zero sized, **<**, **>** lexical comparison
- [condition]** **&&** **[condition]**
- true** – returns 0 value
- false** – returns 1 value
- break** – terminates executed cycle
- continue** – starts new iteration of cycle
- eval parameters** – executes parameters as command
- exit value** – terminates script with return value
- . script**, **source script** – reads and interprets another script
- :** **argument** – just expand argument or do redirect
- alias name='commands'** – expand *name* to commands
- unalias name** – cancel alias
- if [condition]; then commands;**
- elif [condition]; then commands;**
- else commands; fi**
- for variable in arguments; do commands; done**
 - **{a..z}** – expands to **a b c ...z**
 - **{i..n..s}** – sequence from *i* to *n* with step *s*
 - **\{a,b,c\}** – expands to "a" "b" "c"
 - **{1,2}{a,b}** – expands to **1a 1b 2a 2b**
 - **seq start step end** – number sequence
- for((i=1; i<10; i++)); do commands; done**
- while returns true; do commands; done**
- until [test returns true] ; do commands; done**
- case \$prom in value₁) commands ;; value₂) commands ;; *) implicit. commands ;; esac**
- Function definition: function name () {commands; }**
- return value** – return value of the function
- declare -f function** – print function declaration

6. Redirections and pipes

- 0** stdin/input, **1** stdout/output, **2** stderr/error output
- > file** – redirection, create new file or truncate it to zero size
- >> file** – append new data at the end of file
- command₁<<<command₂** – ouput from 2nd to stdin of 1st
- command < file** – read stdin from file
- tee file** – read stdin, writes to file and to stdout
- command 2> file** – redirect error messages to file
- exec 1> >(tee -a log.txt)** – redirect stdout also to file
- 2>&1** – merge stderr and stdout
- exec 3</dev/tcp/addr/port** – create descriptor for network read/write
- exec 3>&-** – close descriptor
- command > /dev/null 2>&1** – suppress all output
- n> n>> n>&m** – operation redirect for descriptors *n*, *m*
- mkfifo name** – make a named pipe, it can be written and read as file
- command₁ | command₂** – pipe, connection between processes
- command 2>&1 | ...** – can be shortened to **command |& ...**
- \$(PIPESTATUS[0])**, **{\${PIPESTATUS[1]}** – retvals before and after pipe
- read parameters** – read input line and separate it into parameters

6.1. Input for interactive programs (here documents)

```
./program << EOF      ./program <<-'EOF' # suppress tabulators
Input1                Input1
Input2                Input2
EOF                   EOF
```

6.2. Process file line by line

cat file.txt | (while read L; do echo "\$L"; done)

7. Evaluating mathematical expressions

- let expression**, **expr expression**, **\$(expression)**, **\$(expression1, expression2)**, **\$(expression)**
- Numeric systems: **base#number**; hexa **0xABC**, octal **0253**, binary

- 2#101101011**
- Operators: **++**, **++i**, **i--**, **--i**, **+**, **-**, *****, **/**, **%** remainder; logical: **!** neg., **&&** and, **||** or; binary: **~**, **&**, **|**; **<<**, **>>** shifts; assignment: **=** ****** **/=** **%=** **+=** **-=** **<>=** **&=** **^=** **|=** **>>=** **<<=**; relations: **<** **<=** **>** **>=**
- factor n** – factorize *n* into primes
- Floating point operations: **echo "scale=10; 22/7" | bc**

8. Screen output

- echo "text"** – print text, **echo *** print all files in current dir
- echo -e "text"** – interpret escape-sequences (**\t** tab., **\a** beep, **\f** new page, **\n** new line), **-n**, **\c** suppressing **\n**, **\xHH** hex-byte, **\nnn** oct. byte, **\u03B1 „α“** (U+03B1) in UTF-8
- stty** – change and print terminal line settings
- tty** – print name of terminal connected to stdout
- printf format values** – format output
- printf -v variable form. val.** – form. output into variable
 - **% [flags][width][.precision][length]specifier**
 - Specifier: **%u,%d,%i** decimal; **%E,%f** float, **%x,%X** hex; **%o** octal, **%s** string, **%c** char **%**
 - Width: *n* prints at least *n* chars, spaces from right, *0n* print at least *n* chars, zeros from left, ***** width specified in preceding parameter
 - Precision: min. number of digits, digits after decimal point, number of printed chars, ***** number of chars given by preceding parameter
 - Flags: **-** left-justify, **+** prints number with sign **+/-**
- printf "%d" \A** – display ASCII code of char “A” (65)
- printf \\\\$(printf '%03o' 65)** – print char given by ASCII code
- tput action** – terminal dependent action
- reset**, **tput sgr0**, **tset** – reset terminal, cancel attributes
- clear**, **tput clear** – clear screen

9. Process management

- command &** – run *command* in background
- prog₁ && prog₂** – run prog₂, if prog₁ ends with success
- prog₁ || prog₂** – rub prog₂, if prog₁ ends with error
- (CTRL+z)** – stop process (SIGSTOP)
- bg/fg** – run last stopped process in background/foreground
- jobs** – list processes running in background
- exec command** – shell is replaced by *command*
- wait** – wait for end of background tasks
- top** – watch CPU, memory, system utilization
- ps -xau** – list processes and users, **ps -xaf**, **pstree** tree listing
- pgrep process**, **pidof process** – get PID by name of process
- nice -n p command** – priority *p* od –20 (max.) to 19 (min.)
- renice -n p -p pid** – change priority of running process
- kill -s k n** – send signal *k* to proces id. *n*, 0, 1 SIGHUP; 2 SIGINT **(CTRL+c)** 3 SIGQUIT; 9 SIGKILL; 15 SIGTERM; 24 SIGSTOP
- trap 'command' signals** – run command when signal received
- killall name** – send signals to process by name
- nohup command &** – command will continue after logout
- time command** – print time of process execution
- times** – print user and system time utilization in current shell
- watch -n s command** – every *s* seconds run command
- timeout N command** – quit command after *N* seconds

10. Time and process planning

- date** – print date, **date --date=@unix_time**
- date +%Y%m%d %H:%M:%S %Z** – format to 20130610 13:39:02 CEST
- cal** – display calendar
- crontab -e** – edit crontab, **-l** list, format *min hour date month day command*, *** * * * *** command run every minute, **1 * * * *** command 1st min of every hour
- at**, **batch**, **atq**, **atrm** – queue, examine or delete jobs for later execution

11. File operations

File name wildchars: **?** a char; ***** zero or more chars; **[set]** one or more given chars, interval **[0-9]** **[a-z]**, **[A-Z]**; **!set**, **[^set]** none of chars.

- ls** – list directory, **ls -la**, **vdir** all files with info
- tree** – display hierarchy tree of directories
- file file** – determine file by its magic number
- lsattr**, **chattr** – list and change file attributes for ext2,3
- umask** – define permission mask for new file
- pwd (-P)** – logical (physical) path to current directory
- cd directory** – change directory, **cd jump to \$HOME**, **cd -** to **\$OLDPWD**
- dirs** – list stack of directories
- pushd directory** – store *directory* to stack
- popd** – set top stack directory as actual directory
- cp source target** – copy file
- ln -s source link** – create a symbolic link
- mkdir**, **rmdir** – create, remove directory
- rm file**, **rm -r -f directory**, **unlink** – delete
- touch file** – create file, set actual time to existing file
- du -h** – display space usage of directories
- stat file** – file statistics, **stat --format=%s size**
- basename name suffix** – remove path or suffix
- dirname /path/to/file** – print only path
- repquota** – summarize quotas for a filesystem
- mktemp** – create file with unique name in **/tmp**

12. Work with file content

- cat** – concatenate files and print them to stdout
- cat > file** – create file, end with **(CTRL+d)**
- mapfile A < file** – store stdin into array **\$A**
- tac** – like cat, but from bottom to top line
- more**, **less** – print by pages, scrollable
- od**, **hexdump -C**, **xxd** – print in octal, hex dump
- wc** – get number of lines **-l**, chars **-n**, bytes **-c**, words **-w**
- head/tail** – print begin/end, **tailf**, **tail -f** wait for new lines
- split**, **csplit** – split file by size, content

- sort -n** numerical, **-r** reverse, **-f** ignore case
- uniq** – omit repeated lines, **-d** show only duplicates
- sed -e 'script'** – stream editor, script **y/ABC/abc/** replaces **A**, **B**, **C** for **a**, **b**, **c**; **s/regex/substitution/**
- tr a b** – replace char *a* for *b*
- tr '[a-z]' '[A-Z]' < file.txt** – change lowercase to uppercase
- awk '/pattern/ {action}' file** – process lines containing pattern
- cut -d delimiter -f field** – print column(s)
- cmp file1 file2** – compare files and print first difference
- diff**, **diff3**, **sdiff**, **vimdiff** – compare whole files
- dd if=in of=out bs=k count=n** – read *n* blocks of *k* bytes
- strings** – show printable strings in binary file
- paste file₁ file₂** – merge lines of files
- rev** – reverse every line

13. Search

- whereis**, **which** – find path to command
- grep --i** ignore case, **-n** print line number, **-v** display everything except pattern, **-E** extended regexp
- locate file** – find file
- find path -name 'file*'** – search for *file**
- find path -exec grep text -H {} \;** – find file containing *text*

14. Users and permissions

- whoami**, **who am i** – tell who I am :)
- w**, **who**, **users**, **pinky**, **finger** – list connected users
- last / lastb** – history successful / unsuccessful logins
- logout**, **(CTRL+d)** – exit shell
- su login** – change user to *login*
- sudo** – run command as other user
- su - login -c 'command'** – run one command as *login*
- id login**, **groups login** – show user details
- useradd**, **userdel**, **usermod** – create, delete, edit user
- groupadd**, **groupdel**, **groupmod** – create, delete, edit group
- passwd** – change password
- pwck** – check integrity of **/etc/passwd**
- chown user:group file** – change owner, **-R** recursion
- chgrp group file** – change group of file
- chmod permissions file** – change permissions in octal of user, group, others; **444=-r--r--r--**, **700=-rwx-----**, **550=-r-xr-x---**
- runuser login -c "command"** – run command as user

15. System utilities

- uname -a** – name and version of operating system
- uptime** – how long the system has been running
- fuser** – identify processes using files or sockets
- lsdf** – list open files
- sync** – flush file system buffers
- chroot dir command** – run command with special root directory
- strace**, **ltrace program** – show used system/library calls
- ldd binary** – show library dependencies

15.1. Disk partitions

- df** – display free space
- mount** – print mounted partitions
- mount -o remount -r -n /** – change mount read only
- mount -o remount -w -n /** – change mount writeable
- mount -t iso9660 cdrom.iso /mnt/dir -o loop** – mount image
- mount -t cifs \\\\server\\ftp /mnt/adr -o user=a,passwd=b**
- umount partition** – unmount partition
- fdisk -l** – list disk devices and partitions
- blkid** – display attributes of block devices
- tune2fs** – change ext2/3/4 filesystem parameters
- mkfs.ext2**, **mkfs.ext3** – build file-system
- hdparm** – set/read parameters of SATA/IDE devices

15.2. System utilization

- ulimit -l** – print limits of system resources
- free**, **vmstat** – display usage of physical, virt. memory
- lspci**, **lsusb** – list PCI, USB devices
- dmesg** – display messages from kernel
- sysctl** – configure kernel parameters at runtime
- dmidecode** – decoder for BIOS data (DMI table)
- init**, **telinit** – command **init** to change runlevel
- runlevel**, **who -r** – display current runlevel

16. Networking

- hostname** – display computer hostname
- ping host** – send ICMP ECHO_REQUEST
- dhclient eth0** – dynamically set **eth0** configuration
- host**, **nslookup host/adr** – DNS query
- dig** – get record from DNS
- whois domain** – finds owner of domain or network range
- ethtool eth0** – change HW parameters of network interface **eth0**
- ifconfig** – display network devices, device configuration
- ifconfig eth0 add 10.0.0.1 netmask 255.255.255.0**
- ifconfig eth0 hw ether 01:02:03:04:05:06** – change MAC address
- route add default gw 10.0.0.138** – set network gateway
- route -n**, **netstat -rn** – display route table
- netstat -tlnp** – display processes listening on ports
- arp** – display ARP table
- iptables -L** – display firewall rules
- tcpdump -i eth0 'tcp port 80'** – display HTTP communication
- tcpdump -i eth0 'not port ssh'** – all communication except SSH
- ssh user@hostname command** – run command remotely
- mail -s "subject" address** – send email to address
- wget -e robots=off -r -L http://path** – mirror given page
